

“the cleanest glove in the world”

THE COMEBACK OF LATEX

Contact dermatitis caused by examination gloves is a growing problem for hospitals and dental practices. Nowadays it is generally not the latex gloves but the synthetic nitrile gloves which are causing mild to severe skin irritation. All over the world type IV allergies are now on the rise, according to various scientists and studies. It is the chemicals used in the manufacturing of synthetic gloves that pose the new danger. The industry currently does not have the answer.

But we at Budev do have!

DO ALLERGY FREE GLOVES EXIST?

To date no manufacturer is legitimately able to make the claim to have developed an allergy free latex glove. But Budev's MPXX™ technology comes closest to making this reality. MPXX™ is a patented batch washing process reducing not only allergens to unquantifiable levels but also chemical residues to undetectable levels. MPXX™ deals therefore with both allergy type I (latex allergy) but also with type IV (contact dermatitis). We use this technique successfully in our Cleantexx and Budexx NRL examination- and procedure gloves. With confidence we dare to state that we produce the cleanest gloves in the world.

New: the cleanest surgical gloves in the world

Based on this knowledge we have recently developed a new NRL sterile surgical glove that is being introduced on Medica, the tradefare in Dusseldorf, Germany. This glove encompasses all our R&D experience of the last 5 years, and underlines our believe in NRL. Since we can produce this superior quality of ultra clean latex there is no reason to use anything else. The cleanest glove in the world will do.

Visit us at Medica and convince yourself, or look at www.mpxx.com.
